

ABSTRACT

2 An imaging apparatus has a primary media tray, a priority media feed tray, and a
3 media feed mechanism configured to extract media from the priority feed tray and the
4 primary media feed tray. The imaging apparatus further includes a priority media
5 release device configured to selectively block media in the priority feed tray from the
6 media feed mechanism, and admit media in the priority feed tray to the priority media
7 feed mechanism. In one configuration the priority media release device has a priority
8 media release member selectively moveable from a first position to block media in the
9 priority feed tray from the media feed mechanism, to a second position to admit media in
10 the priority feed tray to the media feed mechanism.
